

Critique Paper on the Issues and Concerns of Kagan Communities on 'Development'

Tyrone T. Edong

Davao Oriental State University

Bachelor of Science in Development Communication

Sir. Mark Aljen Binocal

June 4, 2024

Introduction:

The article from ZFD addresses the issue and concern about the Kagan community in the context of so called "Development". It provides a broad overview in development that is driven on personal interest of a few, this impact among the Indigenous groups. It highlights displacement, cultural erosion, environmental degradation, and also the socio-economic challenges. This article aims to share the effects of development that fail to incorporate the perspectives and needs of indigenous populations.

Thesis Statement:

While the article effectively brings attention to the struggles of the Kagan people and offers a strong critique of the destructive nature of mainstream development projects, it could be enhanced by incorporating a more balanced exploration of potential solutions. Additionally, it would benefit from a deeper analysis of the structural challenges that hinder the implementation of indigenous development models, providing a more comprehensive understanding of the complexities involved in addressing these issues.

Detailed analysis:

The article underscores the displacement of Kagan communities as a primary concern. Development projects, particularly in mining and infrastructure, often lead to the forced relocation of these communities. This displacement not only disrupts their traditional way of life but also severs their connection to ancestral lands, which hold cultural and spiritual significance. The author's vivid depiction of these consequences highlights the deep-seated trauma and long-term socio-economic instability that such communities endure.

Furthermore, the article emphasizes cultural erosion as a critical issue. The influx of external influences and the imposition of new socio-economic structures threaten the preservation of Kagan cultural heritage. Traditional practices, languages, and communal bonds face the risk of extinction as younger generations are increasingly drawn towards urban lifestyles. This cultural dilution is poignantly portrayed, underscoring the need for development policies that respect and integrate indigenous cultural values.

Environmental degradation emerges as another significant concern in the article. The Kagan communities, whose livelihoods are intricately tied to their natural surroundings, suffer from the ecological impacts of development projects. Deforestation, pollution, and biodiversity loss are rampant, leading to the depletion of natural resources that these communities rely on. The article's detailed accounts of environmental damage serve as a stark reminder of the ecological costs of unchecked development.

The socio-economic challenges highlighted include the loss of traditional livelihoods, increased poverty, and limited access to basic services. The Kagan communities often find themselves marginalized in the new economic order imposed by development projects. The article presents compelling evidence of how development, when not inclusive, exacerbates inequality and disenfranchises indigenous populations.

Despite its strengths in highlighting these issues, the article falls short in offering concrete solutions. While it calls for greater inclusion of indigenous voices in development planning, it does not provide a clear framework for how this can be achieved. The lack of actionable recommendations limits the article's effectiveness in driving meaningful change.

Moreover, the article could benefit from a more balanced perspective. While it rightfully critiques the negative impacts of development, it does not explore potential pathways for sustainable development that could benefit both the Kagan communities and broader One of the article's most poignant arguments is the cultural perspective on development. The imposition of external development paradigms often disregards the Kagan communities' unique worldviews and ways of life. The concept of development, as understood in mainstream discourse, typically prioritizes economic growth and infrastructure over cultural preservation and social cohesion. This clash of values is at the heart of many conflicts between indigenous communities and development agencies.

From the perspective of the Kagan communities, development should be about enhancing their quality of life while maintaining their cultural integrity and autonomy. This viewpoint aligns with the concept of "development with identity," which emphasizes the importance of culturally sensitive development practices that respect and incorporate indigenous knowledge systems and values. In his influential work, *The Development Dictionary*, Wolfgang Sachs (1992) argues that the concept of development is deeply rooted in Western notions of progress and often fails to recognize the cultural and social dimensions of indigenous communities. Sachs highlights the need for 'development with identity,' which respects and

incorporates the values and knowledge systems of local cultures. This perspective aligns with the Kagan communities' views on development, emphasizing the preservation of cultural heritage and autonomy in the face of external development pressures. The article could be strengthened by exploring how development projects can integrate these cultural perspectives to create more inclusive and sustainable outcomes.

The development driven by external actors and profit motives has undeniably brought about infrastructural advancements and economic opportunities. However, for the Kagan and their neighbors, these benefits are overshadowed by significant losses. The degradation of the Hijo River, once a lifeline for the Kagan, is a poignant symbol of this destructive progress. The pollution, deforestation, and disruption of traditional practices starkly contrast with the idyllic past recounted by Salem Demuna, a former chairperson of the Learned Kagan Muslim Foundation, Inc. (LKMFI).

In development theory, this clash can be understood through the lens of **Modernization Theory**, which advocates for the adoption of Western-style industrialization and economic growth. While this approach can yield rapid economic gains, it often neglects the social, cultural, and environmental costs, particularly for marginalized groups.

Modernization theory casts development as a uniform evolutionary route that all societies follow, from agricultural, rural, and traditional societies to postindustrial, urban, and modern forms (Bradshaw, 1987; Escobar, 1995; Chirot and Hall, 1982; Shrum, 2000).

Modernization Theory posits that society's progress through stages of economic development, with industrialization and technological advancement seen as markers of modernity and progress. This theory resonates with the narrative of the Kagan community experiencing the negative consequences of development projects driven by external actors and profit motives. The contrast between their idyllic past and the current socio-economic disruptions aligns with Modernization Theory's emphasis on economic growth as a measure of development.

Modernization Theory has been criticized for overlooking the social, cultural, and environmental costs of rapid economic development. By referencing this theory in the critique, I highlighted the unintended consequences of mainstream development paradigms, such as environmental degradation, cultural erosion, and social disruption, experienced by the Kagan community. This critique helps underscore the need for a more holistic and inclusive

approach to development that considers the well-being of indigenous peoples and their ecosystems.

The United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) establishes a strong foundation for safeguarding indigenous rights in the context of development. These rights could serve as a basis for advocating more inclusive development practices on Indigenous people.

Additionally, the indigenous from another regions like the Asháninka of Peru. The Asháninka have organized to protect their lands from illegal logging and external encroachments. They engage in sustainable forest management practices and have formed alliances with NGOs and government agencies to secure land titles and support community development projects.

The forumZFD article effectively underscores the significant challenges that development poses to the Kagan communities, including displacement, cultural erosion, environmental degradation, and socio-economic marginalization. These insights are crucial for understanding the adverse impacts of the current development paradigm on indigenous communities.

However, to be more impactful, the article could benefit from moving beyond critique and towards proposing actionable solutions. Incorporating insights from international frameworks, successful case studies, and policy recommendations could provide a roadmap for more inclusive and sustainable development approaches. This would address the highlighted issues and promote the rights and aspirations of indigenous communities.

Overall, the forumZFD article is valuable in raising awareness about the critical issues faced by the Kagan communities due to development. It serves as an essential foundation for further discussion and advocacy. By incorporating practical solutions and actionable recommendations, future discourse can better support the creation of development models that honor and respect indigenous rights and cultures, thus enhancing the article's effectiveness and impact.
